

Strategies for Successful Fall and Winter Fairway Color

PRIOR TO DORMANCY

- For optimal results, apply Harrell's SprayMAX® PAR® SG to green, non-dormant turf. Two applications prior to dormancy is ideal.
- Start at 16 oz/acre every two - three weeks or as needed. To enhance color, use PAR® SG along with IronMn Mg at 1 gallon per acre.
- Use with Harrell's MAX® Activator at 8 oz per 50 gal water to maximize leaf surface coverage.
- PAR® SG may dissipate with mowing and rainfall so how often to reapply may be based on turf growth and desired color.

AFTER DORMANCY

- Upon full dormancy, once surrounding turf has turned straw color, apply Harrell's SprayMAX® Dormant Green® to maintain optimal color.
- Apply 2.5 gallons per acre initially, then increase application rate, to achieve desired color, if necessary.
- **Spray Dormant Green® in the presence of dew or pre-wet turf for best results.**
- Number of repeat applications and rate will be determined by weather and desired color.
