

# DIAL IN YOUR COLOR

with PAR® SG

**PAR® SG**, our unique, proprietary color additive, is a pigment designed to provide a brighter, bolder, more natural green enhancement to turf. PAR® SG can be tank-mixed with most fertilizers, growth regulators, wetting agents, fungicides and insecticides to serve as a spray indicator that can dramatically improve application uniformity and consistency. PAR® SG, applied regularly to growing turf, results in the most important “green” of all – beautiful and durable stands of turf, from tee to green.

*Confused about the various ways to green up your turf?  
Product knowledge is power:*

**Paint** - superficial outer coating which can be broken down by sunlight or mown off. Also blocks plant transpiration.

**Dye** - water soluble and therefore loses its physical structure during application, so it fades quickly. Normally used as a spray indicator for pesticide and fertilizer applications.

**Pigment** - low solubility, longer-lasting. Penetrates turfgrass leaves shortly after application, resulting in a more natural look. Even after sunlight exposure and mowing.
